COMPUTATIONAL PHYSICS FOR ACCELERATORS

Accelerating Science

AT FERMILAB

An aerial photograph of the Fermilab particle accelerator complex. The image shows a large, circular track winding through a green, hilly landscape. Several small ponds are visible within the track's path. In the background, there are some industrial or laboratory buildings and more green fields under a clear blue sky with a few wispy clouds.

COMPUTATIONAL PHYSICS FOR ACCELERATORS

Accelerating Science

AT FERMILAB

FERMI NATIONAL ACCELERATOR LABORATORY
Batavia, Illinois

Home of the Tevatron, the world's most powerful particle accelerator.

**What are
accelerators
good for?**

What are accelerators good for?

Medical Applications—cancer-therapy

Materials Science—structure of materials

Biology—resolve fine details of biological systems

Nuclear Physics Research—heavy ion, dense matter

Particle Physics Research—Higgs, new particles, dark matter

Precision Targeted Neutron Therapy

Protein Structure

**Accelerator
simulation
gives you...**

Accelerator simulation gives you...

Faster—design, commissioning

Cheaper—simulate, don't prototype

Better—explore new ideas, enhancements

Main control room

Tevatron tunnel

**Where are
accelerators
used?**

Where are accelerators used?

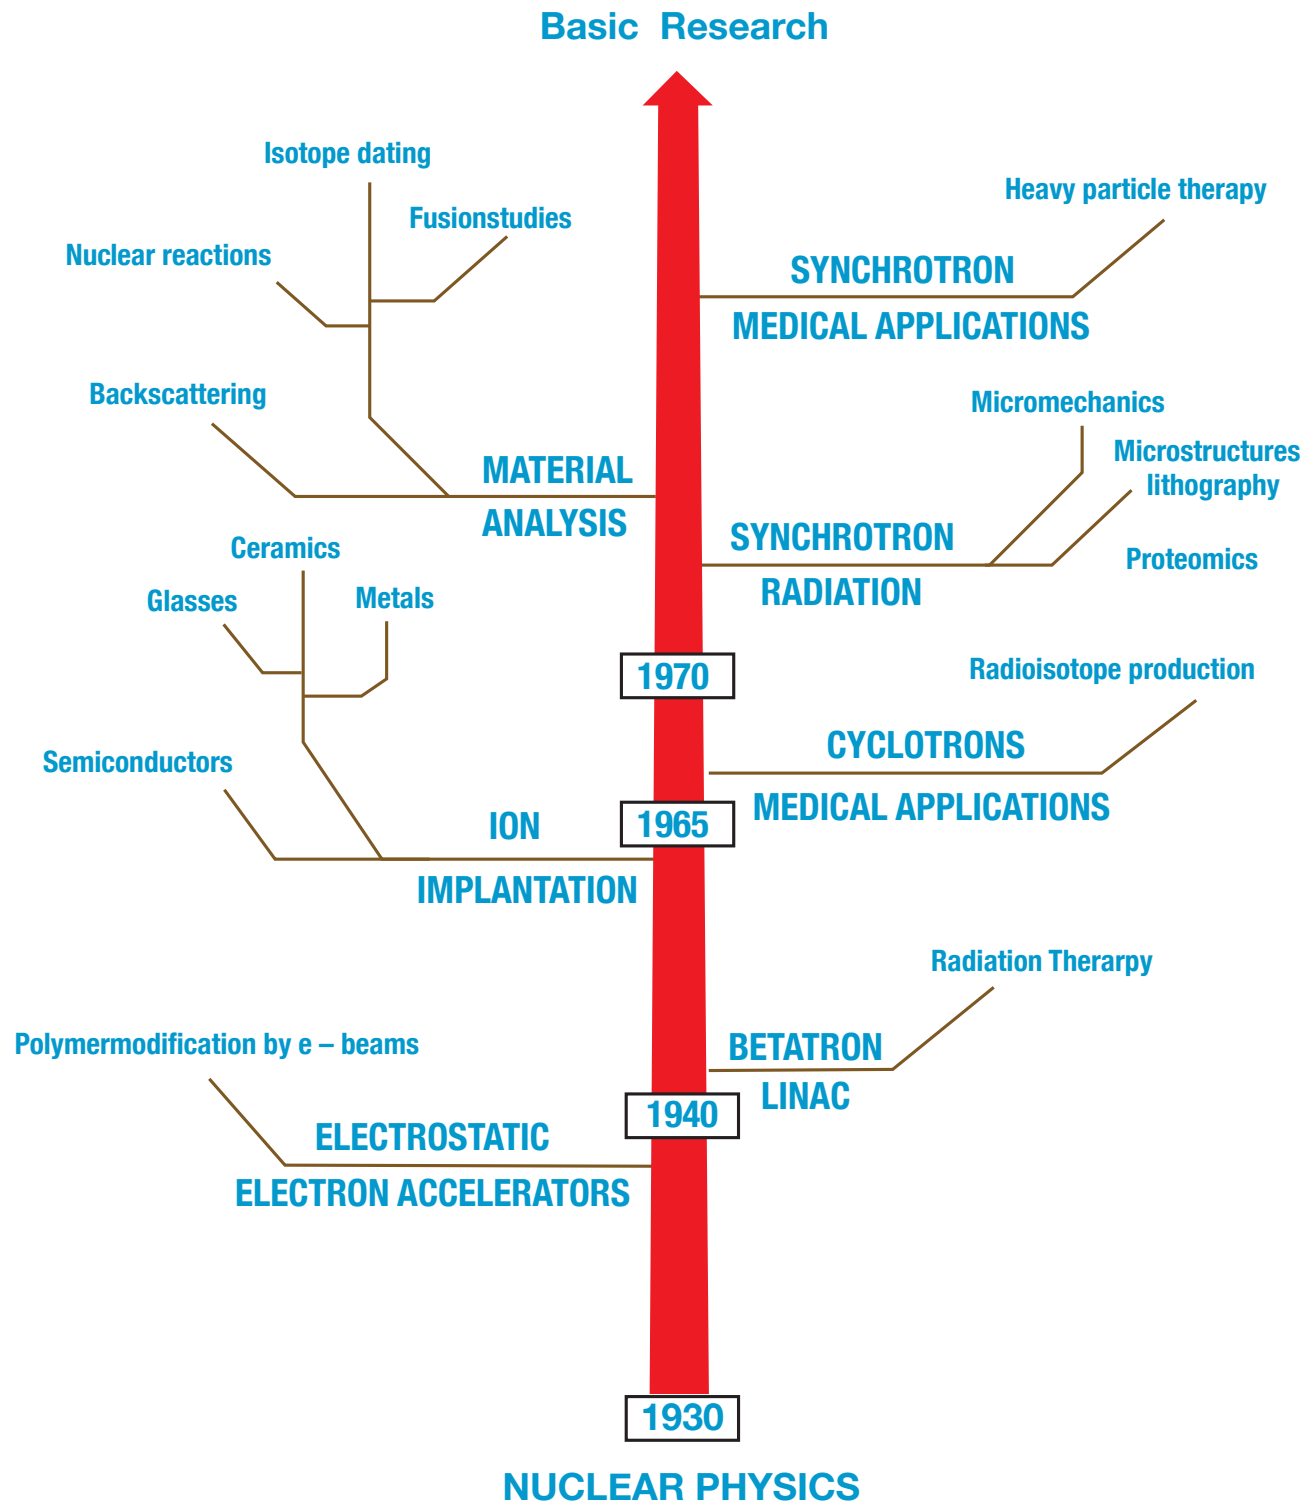

Atomic physics—Atomic collision processes, study of excited states, electron-ion collisions, electronic stopping power in solids

Condensed matter physics—X-ray studies of crystal structure; Neutron scattering studies of metals and crystals, liquids, and amorphous materials

Material science—Proton and X-ray activation analysis of materials; X-ray emission studies; accelerator mass spectrometry

Chemistry and biology—Chemical bonding studies: dynamics and kinetics; protein and virus crystallography; biological dynamics

Medicine—Radiation therapy

Cancer treatment with hadron therapy

Laser targeted
neutron therapy

Treatment of
squamous
cell carcinoma

Before

After (two years)

Resolve structure of biological agents at synchrotron light sources

Structure of two proteins involved in the development of cancer and aging elucidated by x-ray crystallography at the NSLS, Brookhaven National Laboratory by a group from the Wistar Institute and Johns Hopkins University.

Telomerase

Histone acetyltransferase

Materials science at synchrotron light sources

Crystal and magnetic structure at the interface between ferromagnetic and superconducting oxide

Surface properties studied at the Advanced Photon Source

Nanoparticle halo around microspheres in colloidal solution

Nuclear Physics Research

Gold-Gold nucleus collisions and
production of quark-gluon plasma

Particle Physics Research

CDF t quark pair event showing both quarks decaying into B mesons marked by the decay vertices displaced from the interaction point shown in the magnified central track region.

A ZZ event recorded by the DZero experiment at Fermilab. Each Z boson decays into a pair of high energy muons indicated by the green towers.

Particle Physics Research

All of these accelerator applications will need to depend on computer simulations for the design and understanding of new accelerator components, techniques, and improved performance.

Beam-Beam Effect at the Fermilab Tevatron

Measured losses

Computed beam blowup

Tevatron ring

Electromagnetic interactions between bunches cause spreading and loss efficiency.
